

Docket No.: 66329/31254

PATENT

1. (Original) A method for continuously updating a printer driver associated with a printer configuration, the steps comprising:

monitoring a key value associated with a registry on a controller upon startup thereof;

retrieving current printer configuration from a registry on a controller in accordance with an output of the monitoring means;

accessing an external file containing at least one offset representative of a respective at least one printer attribute;

querying the at least one offset representative of the respective at least one printer attribute; and

updating a data structure containing information about initialization and environment of a printer.
